

Bad Seismic Penetration? Low Quality Seismic Sections?

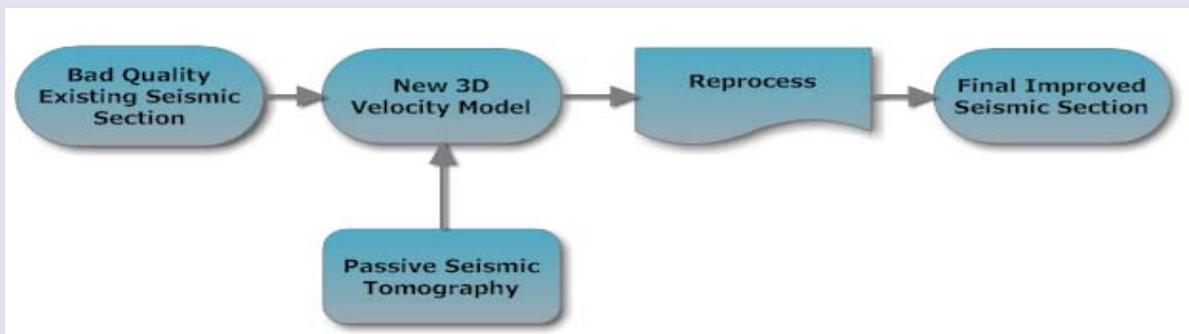

**Use passive seismic velocity volumes to reprocess your data
and reveal your targets!**

Our passive seismic methodology is so accurate that you can use the passive seismic tomography velocity cubes which we provide, to reprocess any existing (or planning to do) seismic sections and reveal your targets.

Velocity is a key factor in processing (e.g. migrate) your seismic data. In many cases where seismic energy penetration problems are encountered, due to complicated thrust belt geologies, and/or irregular topographic relief's etc., we end up with wrong velocity assumptions and finally confusing seismic sections .

There have been many cases where our clients after having completed a 3D passive investigation they used our velocity data to reprocess (e.g. post stack depth migration) their old useless seismic sections with astonishing results.
